

Theme sweep report

Example theme, swept 19 October 2026

This is an example report for an example theme, not a real store. It shows what a Bracket sweep report contains and how each finding is explained.

Summary

6 findings: 5 changes we could make, and 1 piece of advice. The report is yours to keep. Use it yourself, give it to your developer, or choose the changes you'd like Bracket to make for the fixed price shown.

#	Finding	Area	Where	If we do it
1	Your main image waits its turn	Speed	sections/image-banner.liquid:22	\$4
2	One script holds up every page	Speed	layout/theme.liquid:10	\$16
3	Your cart's close button has no name	Accessibility	snippets/cart-drawer.liquid:7	\$4
4	Product grids jump as they load	Speed	snippets/card-product.liquid:23	\$8
5	Liquid that Shopify has retired	Up to date	sections/header.liquid:59	\$4
6	An app's script loads on every page	Speed	layout/theme.liquid:41	Advice
All 5 changes				\$36

What this sweep covered

The theme's layout, sections, snippets and templates. App code is flagged when it affects the theme, but we don't change it. Shopify checkout is not part of the theme and isn't covered.

Next steps

Fix things yourself or with your developer, using the file, line and change for each finding. To use an AI assistant, download prompt.txt from Bracket and paste it in. Or tick the changes you want Bracket to make: each is prepared on an unpublished copy of your theme and checked, and you decide what to publish.

Findings

1. Your main image waits its turn

If we do it: \$4

Speed · sections/image-banner.liquid, line 22

What we found. The banner at the top of your home page is set to load lazily, so the browser fetches it late. It's the largest thing on screen, so it sets your LCP time.

What to change. Remove loading="lazy" from this image and add fetchpriority="high", so the browser requests it straight away. Keep lazy loading on images further down the page.

```
12 {% liquid
13   assign image = section.settings.image
14   assign height = section.settings.image_height
15 -%}
16
17 <div id="Banner-{{ section.id }}" class="banner banner--{{ height }}">
18   <div class="banner__media media">
19     {% if image != blank -%}
20       
25     {% endif -%}
26   </div>
```

2. One script holds up every page

If we do it: \$16

Speed · layout/theme.liquid, line 10

What we found. vendor.js loads in the head without defer, so nothing on the page appears until it has downloaded and run.

What to change. Add defer to this script tag so it stops blocking the page. First check whether inline scripts or other theme code expect vendor.js to have run already.

```
1 <!doctype html>
2 <html class="no-js" lang="{{ request.locale.iso_code }}">
3   <head>
4     <meta charset="utf-8">
5     <meta name="viewport" content="width=device-width,initial-scale=1">
6     <link rel="canonical" href="{{ canonical_url }}">
7     <title>{{ page_title }}</title>
8     {% render 'meta-tags' -%}
9     {{ 'base.css' | asset_url | stylesheet_tag }}
10    <script src="{{ 'vendor.js' | asset_url }}"></script>
11    <script src="{{ 'global.js' | asset_url }}" defer></script>
12    {{ content_for_header }}
13  </head>
14  <body class="template-{{ template.name }}">
15    {% sections 'header-group' %}
```

3. Your cart's close button has no name

If we do it: \$4

Accessibility · snippets/cart-drawer.liquid, line 7

What we found. It only contains an icon, so a screen reader announces it as “button” with nothing to say what it does.

What to change. Give the button an accessible name, such as `aria-label="Close cart"` or a translated label from the theme's locale files.

```
1 <cart-drawer class="drawer">
2   <div id="CartDrawer" class="cart-drawer">
3     <div class="drawer__overlay"></div>
4     <div class="drawer__inner" role="dialog" aria-modal="true">
5       <div class="drawer__header">
6         <h2>{{ 'sections.cart.title' | t }}</h2>
7         <button class="drawer__close" type="button">
8           {% render 'icon-close' %}
9         </button>
10      </div>
11      <cart-drawer-items>
12        {%- for item in cart.items -%}
13          {%- render 'cart-item', item: item -%}
14        {%- endfor -%}
15      </cart-drawer-items>
```

4. Product grids jump as they load

If we do it: \$8

Speed · snippets/card-product.liquid, line 23

What we found. Product images don't say how big they are, so the page shifts as each one arrives. Google measures this as CLS.

What to change. Add width and height attributes from the image's own dimensions (`media.width` and `media.height`), so the browser reserves the space before the image arrives.

```
19 {%- assign media = card_product.featured_media -%}
20 <div class="card__inner">
21   {%- if media -%}
22     <div class="card__media">
23       
29     </div>
30   {%- endif -%}
31   <div class="card__content">
32     <h3>{{ card_product.title | escape }}</h3>
33     {%- render 'price', product: card_product -%}
```

5. Liquid that Shopify has retired

If we do it: \$4

Up to date · sections/header.liquid, line 59

What we found. Two tags in your header still use `include`, which Shopify deprecated because it's slower and harder to maintain. Its replacement is `render`.

What to change. Replace both `include` tags with `render`. A rendered snippet can't see the parent template's variables, so check what each snippet uses and pass it in explicitly.

```
51 {% liquid
52   assign menu = section.settings.menu
53 -%}
54 <header class="header header--{{ section.settings.logo_position }}">
55   <a href="{{ routes.root_url }}" class="header__heading-link">
56     {% render 'header-logo' -%}
57   </a>
58   <div class="header__icons">
59     {% include 'icon-account' %}
60     {% include 'cart-icon-bubble' %}
61     {% render 'header-search' -%}
62   </div>
63 </header>
```

6. An app's script loads on every page

Advice, no charge

Speed · layout/theme.liquid, line 41

What we found. A reviews app loads its script on every page, including pages with no reviews. It's the app's code, so we won't change it.

What to do. Leave it in place, and ask the app's developer whether its script can load only on pages that show reviews.

```
33   <main id="MainContent" class="content-for-layout">
34     {{ content_for_layout }}
35   </main>
36
37   {% sections 'footer-group' %}
38   {% render 'cookie-banner' -%}
39
40   {{ 'cart.js' | asset_url | script_tag }}
41   <script src="https://cdn.reviews.example/widget.js"></script>
42   <script>
43     window.shopUrl = '{{ request.origin }}';
44   </script>
45 </body>
46 </html>
```
